

PROTOCOL FOR EVALUATION, TREATMENT, AND FOLLOW-UP OF CHRONIC HEPATITIS B- 2025

Standard Operating Procedure for the Management of Chronic Hepatitis B among Tibetans by Primary Care Physicians

GUIDELINES FOR TREATING CHRONIC HEPATITIS B:

Treat all adults and adolescents (≥ 12 years) with CHB (including pregnant women and girls, and women of reproductive age) with:

1.	<p>Evidence of significant fibrosis ($\geq F2$) based on APRI score of >0.5 or transient elastography (Fibroscan) value of $> 7\text{kPa}$ or</p> <p>Evidence of cirrhosis (F4) based on clinical criteria or an APRI score of >1 or transient elastography (fibroscan) value of $>12.5\text{kPa}$</p> <p>Regardless of HBV DNA or ALT levels.</p> <p><i>Note: Clinical features of decompensated cirrhosis: portal hypertension (ascites, variceal haemorrhage and hepatic encephalopathy), coagulopathy or liver insufficiency (jaundice). Other clinical features of advanced liver disease and cirrhosis may include: hepatomegaly, splenomegaly, pruritus, fatigue, arthralgia, palmar erythema and oedema.</i></p> <p style="text-align: center;"><u>OR</u></p>
2.	<p>HBV DNA $>2,000$ IU/ml and an ALT level above the upper limit of normal (ULN)</p> <p><i>Note: For ALT$>$ULN, take the upper limit of your respective labs (Ideally the machine should be calibrated). If the laboratory ULN is not known then take ULN of ALT as 35U/L for men and 25U/L for women.</i></p> <p><i>Note: For adolescents, this should be based on ALT$>$ULN on at least 2 occasions in a 6- to 12- month period.</i></p> <p style="text-align: center;"><u>OR</u></p>
3.	<p>Presence of any of the following: (regardless of APRI score, HBV DNA or ALT level)</p> <ul style="list-style-type: none">• Co-infections (eg. HIV, hepatitis D, hepatitis C)• Family history of liver cancer or cirrhosis• Immune suppression (eg. long-term steroids, solid organ or stem cell transplant)• Co-morbidities (eg. diabetes, metabolic dysfunction-associated steatotic liver disease)• Extra-hepatic manifestations (eg. glomerulonephritis or vasculitis)

PREVENTION OF MOTHER-TO-CHILD TRANSMISSION (MTCT) OF HEPATITIS B:

INTERVENTION	DETAILS	TIMING
Newborn Prophylaxis (Active-Passive Immunization)	<p>All infants born to HBsAg positive mothers must receive both:</p> <p>1.Hepatitis B Immune Globulin (HBIG) (Passive immunity)</p> <p>2.Hepatitis B Vaccine: Birth dose followed by 3 additional doses</p>	<p>HBIG: Must be administered within 12hours of birth.</p> <p>Hepatis B Vaccine-Birth dose must be administered within 24hours of birth.</p>
Maternal Antiviral Prophylaxis	<p>Recommended for mothers with:</p> <p>HBV DNA viral load of >200,000 IU/mL</p> <p>OR</p> <p>HBeAg positive</p>	<p>Second Trimester-Preferably around 28 weeks.</p> <p>To be continued until at least delivery or completion of infant HBV vaccination series. <i>(Provided the antiviral was started solely for the prevention of MTCT because she had a high viral load (HBV DNA > 200,000 IU/mL) or HBeAg positive but otherwise had inactive liver disease (normal ALT, no cirrhosis).</i></p> <p>Monitor closely for at least 6 months postpartum to detect and manage a flare.</p>
Drug of Choice	<p>Tenofovir Disoproxil Fumarate (TDF)</p>	<p>Note:</p> <p>For those already on antiviral therapy: TDF should be continued; ETV or TAF should be switched to TDF at first antenatal visit.</p>

Note: Breastfeeding is not contraindicated among women taking TDF.

Selection of Antivirals for Chronic Hepatitis B

Antiviral drug of choice:

1. Tenofovir alafenamide (TAF) 25mg
2. Tenofovir disoproxil fumarate (TDF) 300mg:
 - If TAF is unavailable or unaffordable
 - Drug of choice in pregnant females
3. Entecavir: children aged 2 to 11 years

Baseline Evaluation of Patients with Chronic Hepatitis B

1	Complete history (including family history of cirrhosis or HCC) and physical examination (evaluate for signs and symptoms of cirrhosis)
2	Full LFTs
3	CBC
4	HBV-DNA (Quantitative)
5	HBeAg
6	AFP
7	Serum Creatinine
8	Ultrasound Liver
9	Anti-HCV
10	HIV with pre and post-test counselling
Optional Test	
11	PT/INR
12	Fibro-scan

Monitoring of Patients - RECEIVING TREATMENT

Cirrhosis- Monitor every 6months	1.	CBC
	2	LFT
	3	AFP
	4	HBV DNA Level
	5	Creatinine
	6	Ultrasound abdomen
		<i>APRI Score</i>
		<i>Monitor for treatment adherence at each visit</i>
Non cirrhosis- Monitor annually	1	CBC
	2	LFT
	3	AFP
	4	HBV DNA Level
	5	Creatinine
	6	Ultrasound abdomen
	7	Fibroscan/ Shear Wave Elastography if available
		<i>APRI Score</i>
	<i>Monitor for treatment adherence at each visit</i>	
		<i>*NOTE: For persistently undetectable HBV DNA levels: HBsAg (Quantitative test) is advised.</i>

Monitoring of Patients – NOT YET RECEIVING TREATMENT

Monitor: Every 6months (Preferred) Annually (Minimum)	1	CBC
	2	LFT
	3	AFP
	4	HBV DNA Level
	5	USG abdomen
	6	Fibroscan/ Shear Wave Elastography if available
		<i>APRI Score</i>

When to Refer

1	Acute Flare
2	All Cirrhosis (Decompensated/ Compensated)
3	Co-infection with HCV or HDV or HIV
4	Immune suppression (eg. long-term steroids, solid organ or stem cell transplant)
5	Co-morbidities (eg. diabetes, metabolic dysfunction-associated steatotic liver disease)
6	Extra-hepatic manifestations (eg. glomerulonephritis or vasculitis)
7	Treatment failure
8	SOL liver (Space occupying lesions)
9	Patients opting for IFT (interferon therapy)
10	Pregnancy

When to Stop Treatment?

(Advisable to seek expert opinion before stopping)

Antiviral therapy is lifelong. Discontinuation can be considered exceptionally for:

1. People without evidence of cirrhosis [based on clinical criteria or non-invasive test (APRI or Fibroscan) score];
AND
 2. Persistently normal ALT levels and persistently undetectable HBV DNA levels;
AND
 3. Who can be followed carefully after discontinuation and long term for reactivation;
AND
- 4a. For previously HBeAg positive patients: Evidence of HbeAg Loss and seroconversion to Anti HBe and after completion of atleast one additional year of treatment.
- OR
- 4b. For previously HBeAg negative patients: Persistent HBsAg loss and after completion of atleast one additional year of treatment.
